Project Title: Banking Management System

Module Photographs: (3 photographs –Module Photo, Individual student contribution module work in the project and presentation image)

Project Description: This project is about developing a Banking Management System using the C programming language to simplify and automate basic banking activities. The system is designed to manage customer accounts and perform operations such as creating accounts, checking account details, depositing and withdrawing money, transferring funds, updating customer information, and deleting accounts. To ensure that account and transaction information is not lost when the program is closed, the system uses file handling to store data permanently in files.

My contribution focused on the frontend design and system testing of the Banking Management System. I designed a simple and user-friendly interface for accessing different banking operations. The interface was organized with clear menus and options for easy navigation. I worked on making the system inputs and outputs clear and understandable to the user. I tested different banking operations to verify that they produced the expected results. Various valid and invalid inputs were tested to identify errors and usability issues. Based on the testing, necessary improvements were made to the interface and functionality. This contribution helped improve the overall usability, reliability, and user experience of the system.
